

# Jets at CMS

Fedor Ratnikov,  
University of Maryland

MIT, August 1, 2008

---

# Introduction

- I am in *CMS JetMET POG* since 2005
  - Since beginning of the *CMSSW* era
- Exclusively responsible for design and implementation of jet reconstruction chain, as well as for design and implementation of Jets Energy Corrections machinery
- Involved into and support most ongoing Jet activities
- Jet contact for the *CMS RECO* group

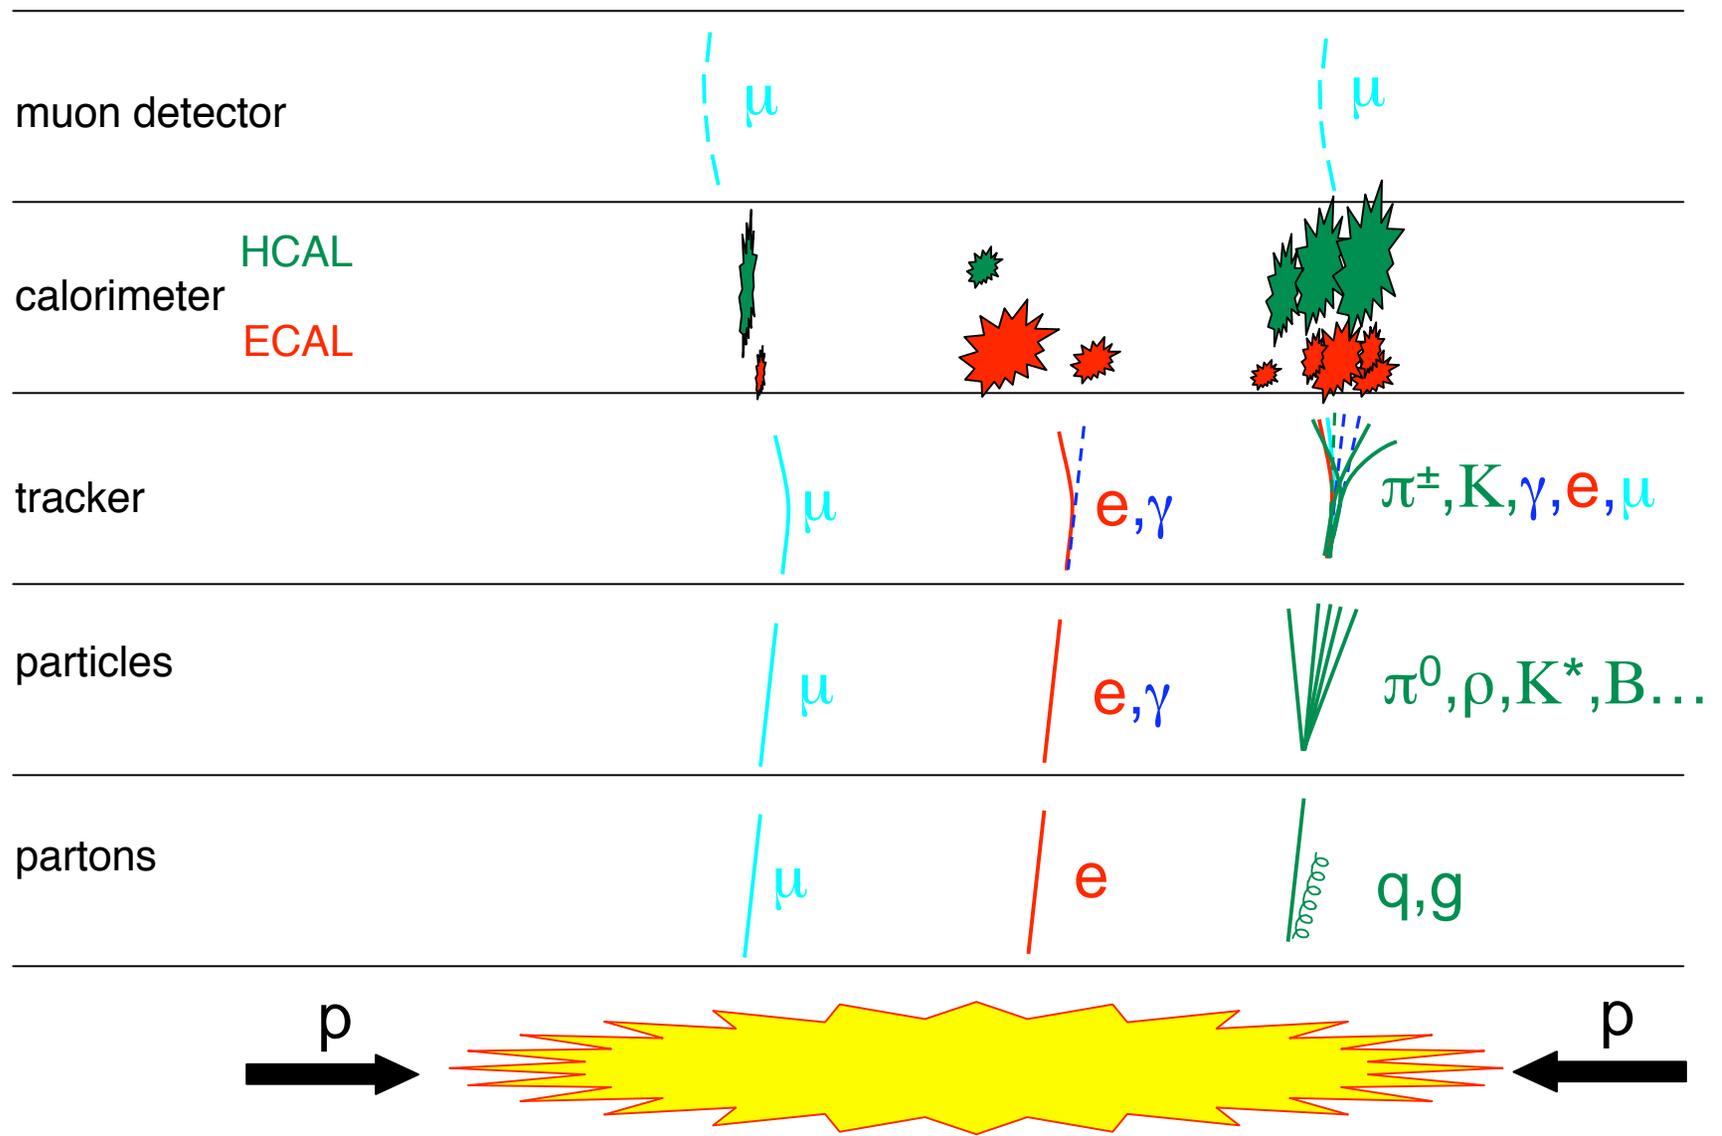

# Credits

- CMS Jet/MET DPG is a big team
- This presentation includes results obtained by different people
  - A.Anastassov, A.Bhatti, V.Buege, J.Cammin, F.Chlebana, R.Harris, S.Essen, O.Kodolova, K.Kousouris, A.Nikitenko, A.Oehler, D. del Re, G.Salam, M.Zielinski

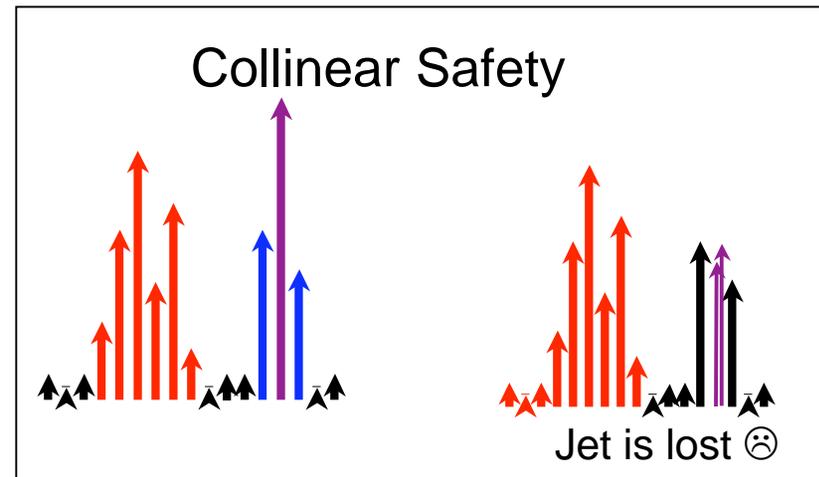

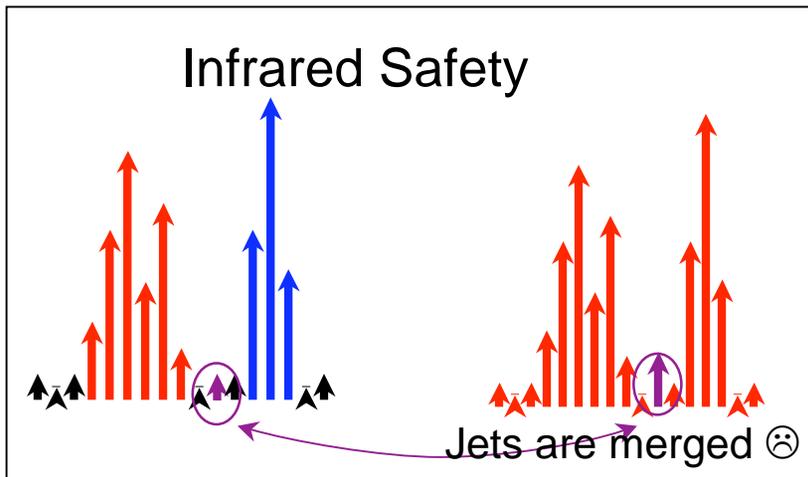

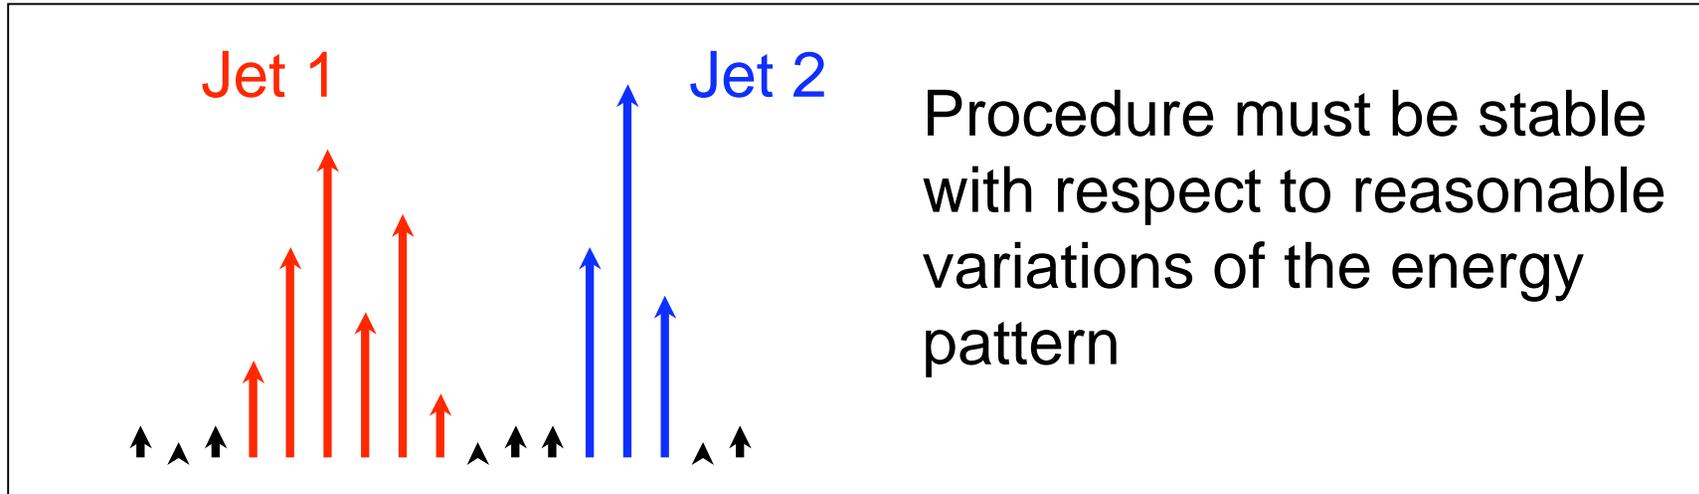

# Outline

- Why jets are tricky
- Jet reconstruction algorithms
  - General requirements
  - Algorithms used at CMS
  - Performance
- Jet flavors: CaloJets GenJets, PFJets
- Jet reconstruction software design
- Resolution, efficiency
- Jet Energy Corrections
  - Generic design
  - Supported corrections
- Summary

# Basic Reconstructed Physics Objects

# Requirements to Jet Algorithms

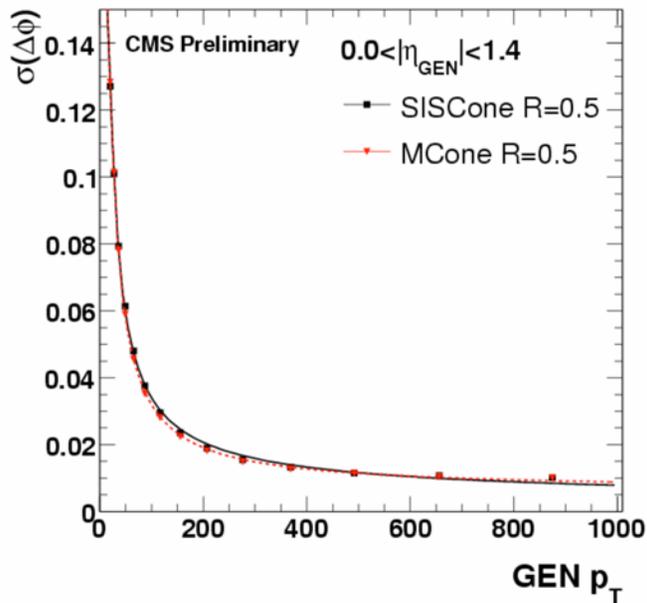

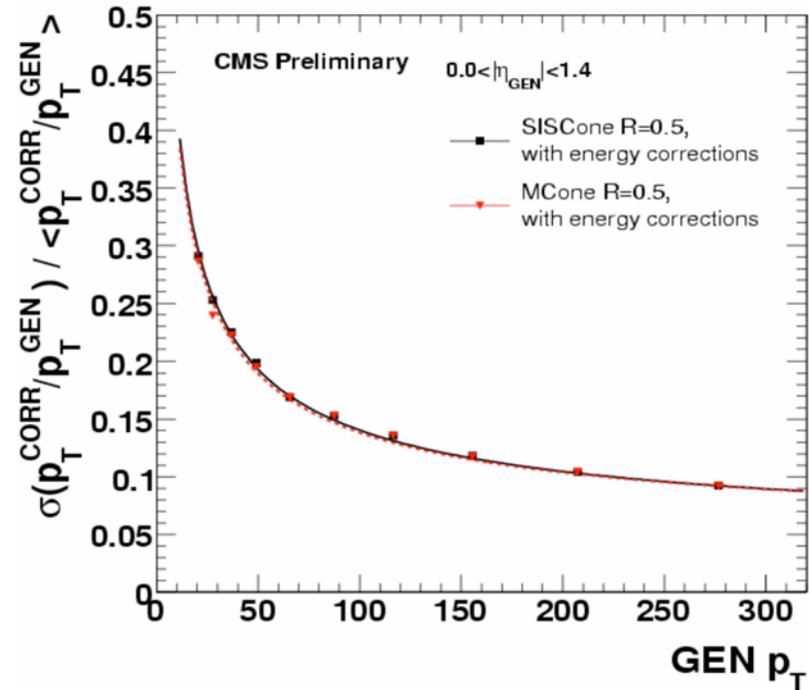

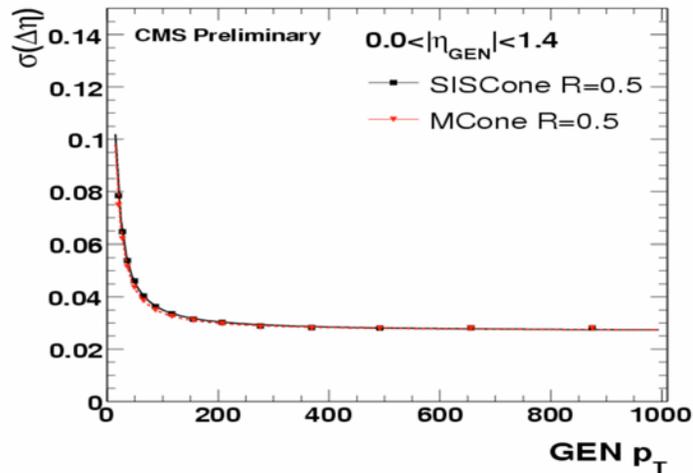

# Jet Algorithms

- Iterative Cone
  - Seeded
  - Single pass - fast
  - $IR_2$  unsafe, collinear unsafe
- CDF Midpoint Cone
  - Seeded
  - With split/merge passes
  - $IR_3$  unsafe, collinear unsafe

# Jet Algorithms (cont)

- $k_T$ 
  - Seedless
  - $N^3 \rightarrow N \cdot \ln(N)$  - fast
  - IR, collinear safe
- Seedless Infrared Safe Cone (SISCone)
  - Seedless
  - $N^4 \rightarrow N^2 \cdot \ln(N)$  - Reasonably fast
  - IR, collinear safe
- CMS routinely uses
  - IC  $R=0.5$
  - SISC  $R=0.5, R=0.7$
  - $k_T$   $D=0.4, D=0.6$

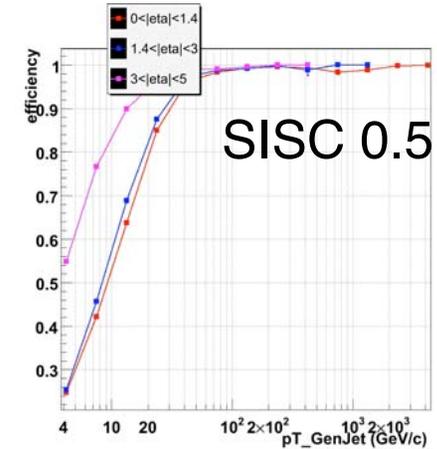

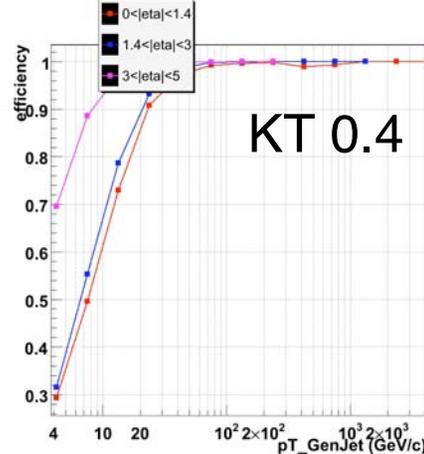

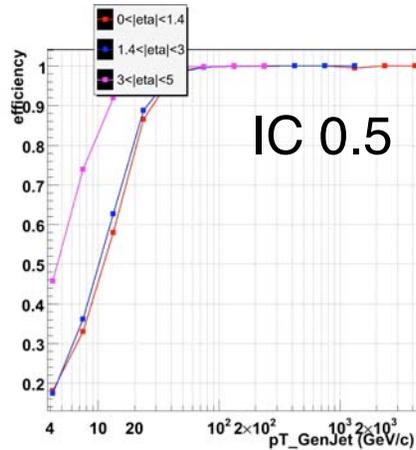

# Midpoint Cone vs SIS Cone

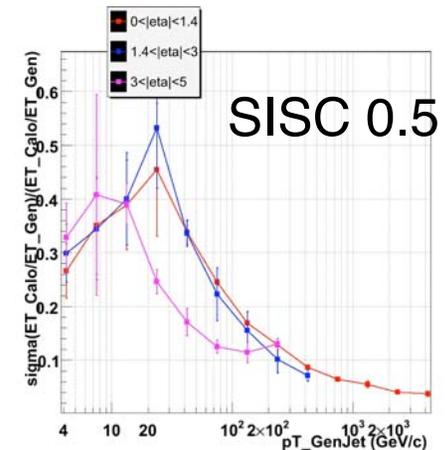

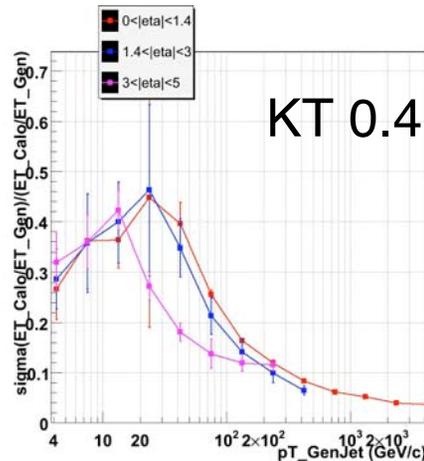

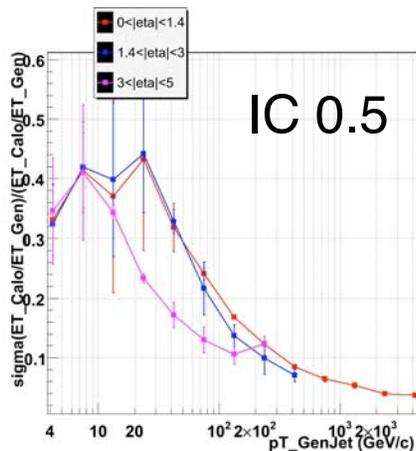

- CMS switched to using SIS Cone instead of Midpoint Cone recently

# Comparing Jet Properties

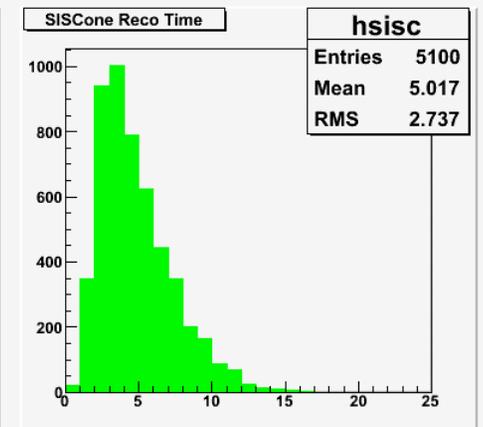

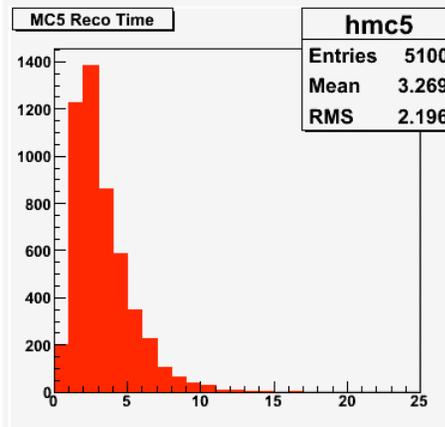

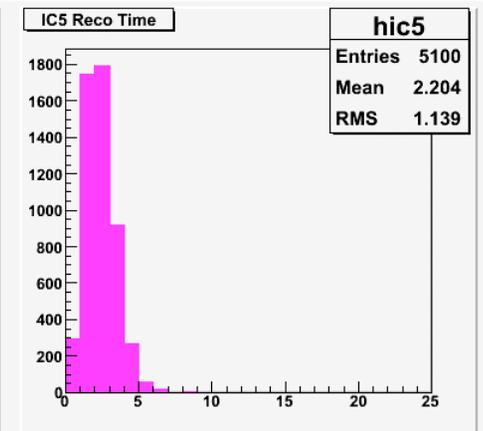

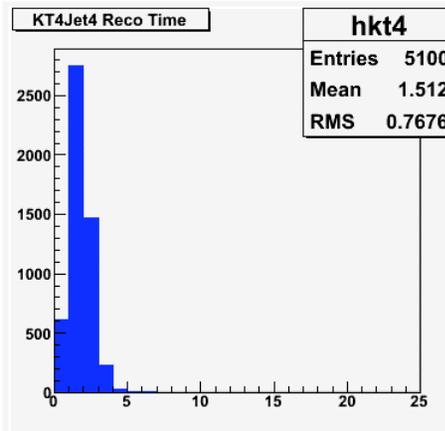

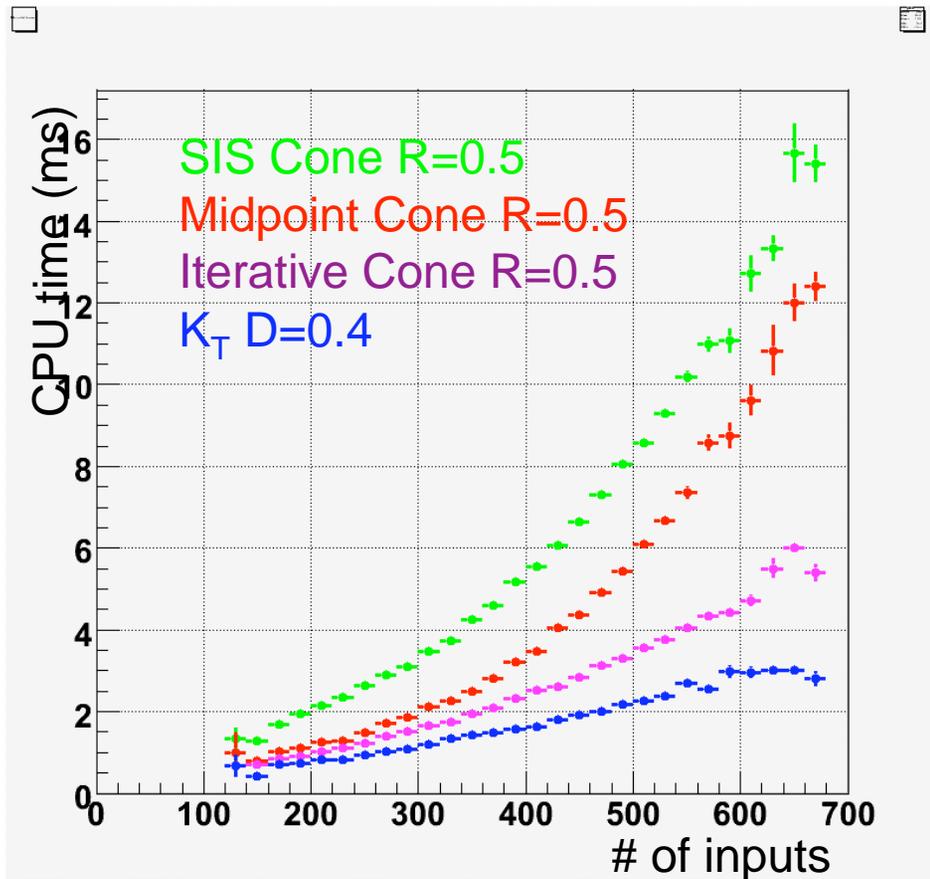

## Jet reconstruction efficiency

## Jet energy resolution

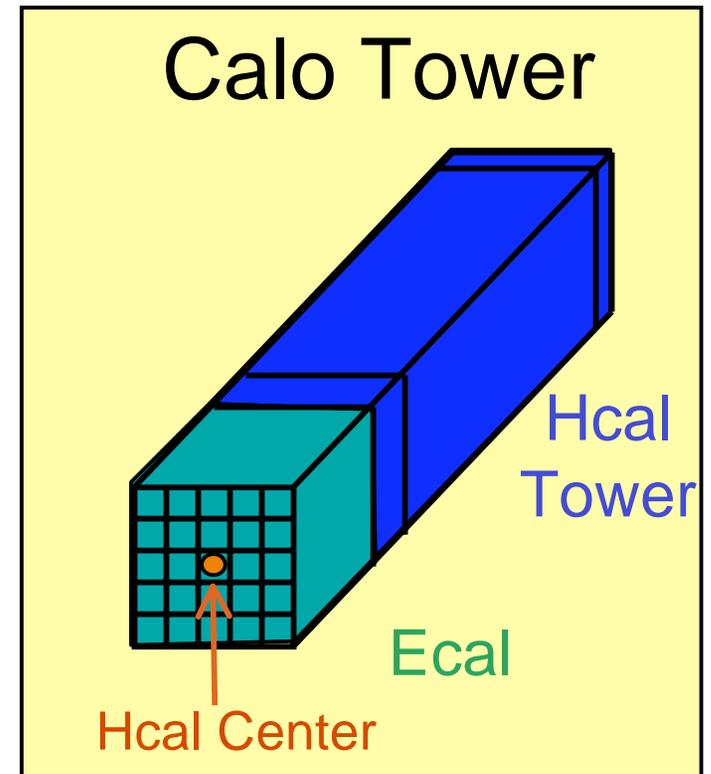

# Algorithms Speed

# CaloJets

- Baseline for Jet reconstruction at CMS
- Input is CaloTower
  - Mostly follow HCAL granularity
  - Contains few HCAL cells and many (25 in the barrel) ECAL cells

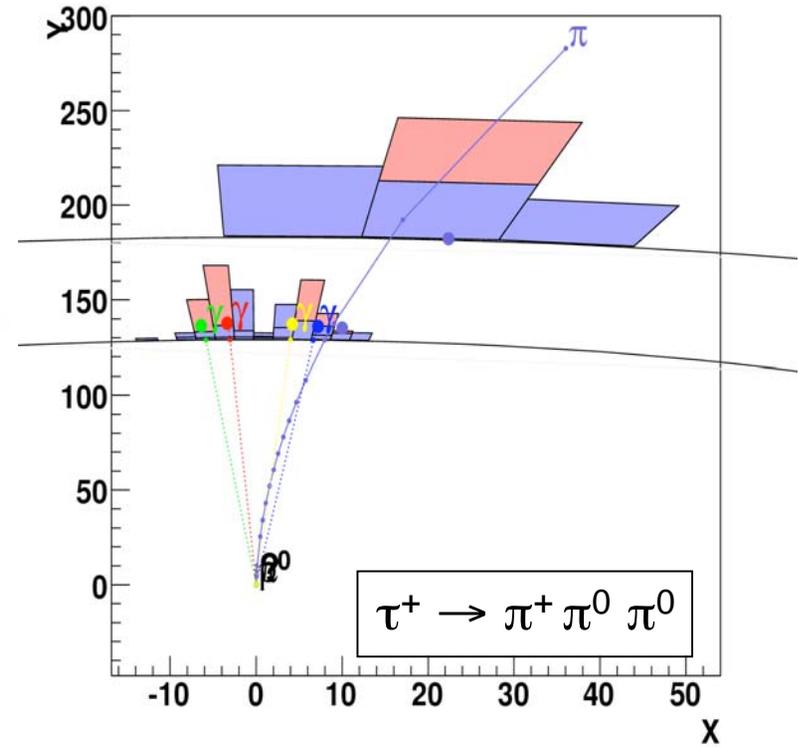

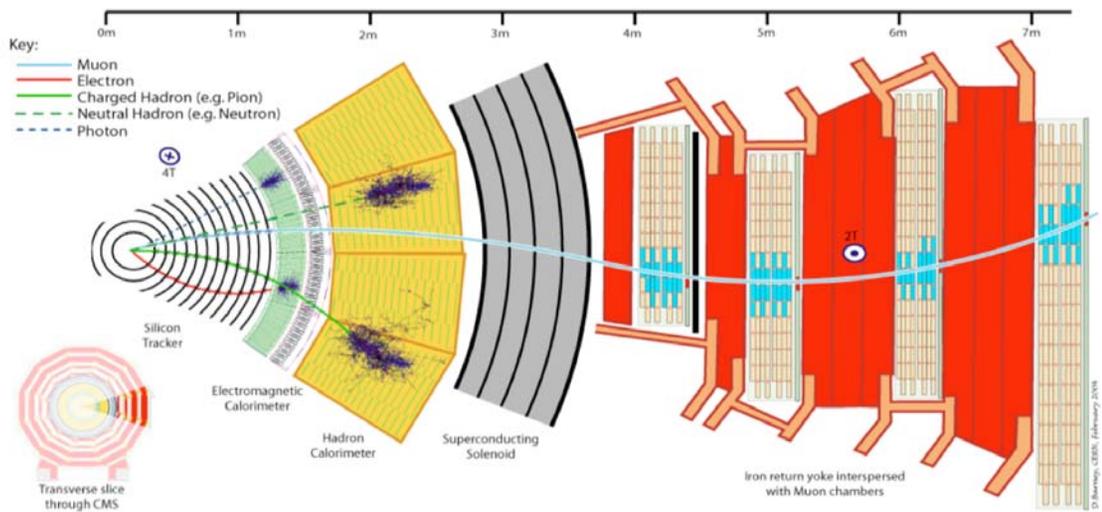

- CaloJets include information about electromagnetic fraction, energies deposited in different subdetectors etc.
- Produce CaloJets for every approved algorithm
  - Part of "RECO" sequence
- People are free to run own jet algorithm on CaloTowers
  - Necessary information is available in all standard datasets

# GenJets

- Clustering energies of MC level particles
- Include "invisible" particles?
  - Muons
  - Neutrinos
  - SUSY, if any
- Current approach
  - Include all "invisible" except ones from prompt decays of gauge bosons
- Produce GenJets for every approved algorithm
  - Part of "post SIM" sequence
- People are free to make own selection of MC particles and run jet algorithm on them
  - Necessary information is available in all standard datasets

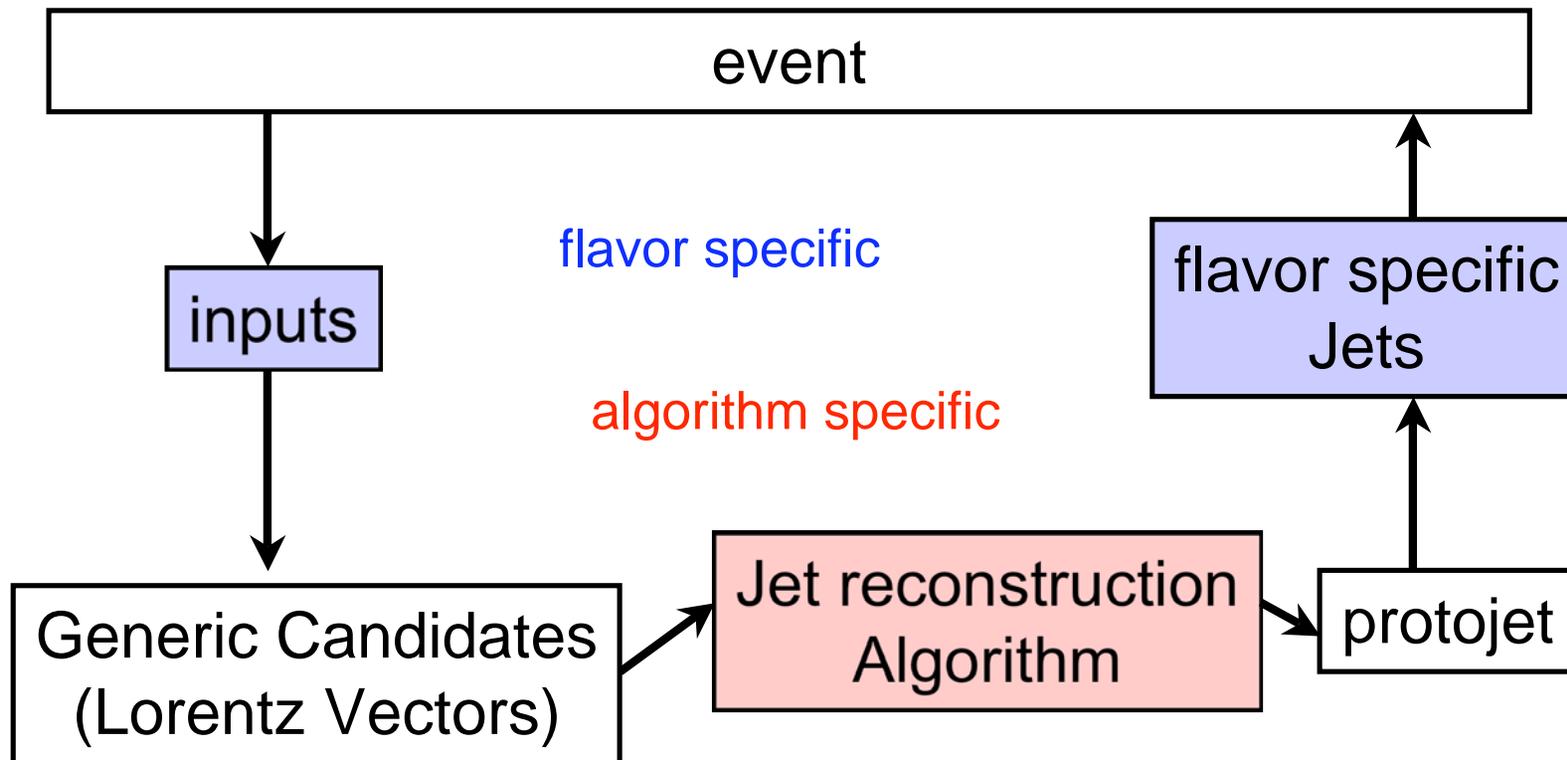

# PFJets

- PFCandidate combines information from various detectors to make the best combined estimation of particle properties
- PFJet is made from PFCandidates and contains information about contributions of every particle class:
  - Electromagnetic/hadronic
  - Charged/neutral

# Jet Reconstruction at CMS

- Factorize algorithms and jet flavors
  - Algorithms treat inputs as set of 4-momenta
  - Flavor specific pre/postprocessing are shared by all algorithms

# HI Specifics

- HI events are huge on particle level
- Not a big deal for CaloJets
  - Not more than ~5K fired CaloTowers anyway
- Big deal for GenJets
  - One event - 35K particles
  - SIScone killer (remember:  $N^2 \text{Ln}N$  algorithm)
    - 40 min of CPU time
    - 30 Gbytes of memory
    - In most cases just crashes the reconstruction job
  - $k_T$  survives: takes ~20 sec of CPU time

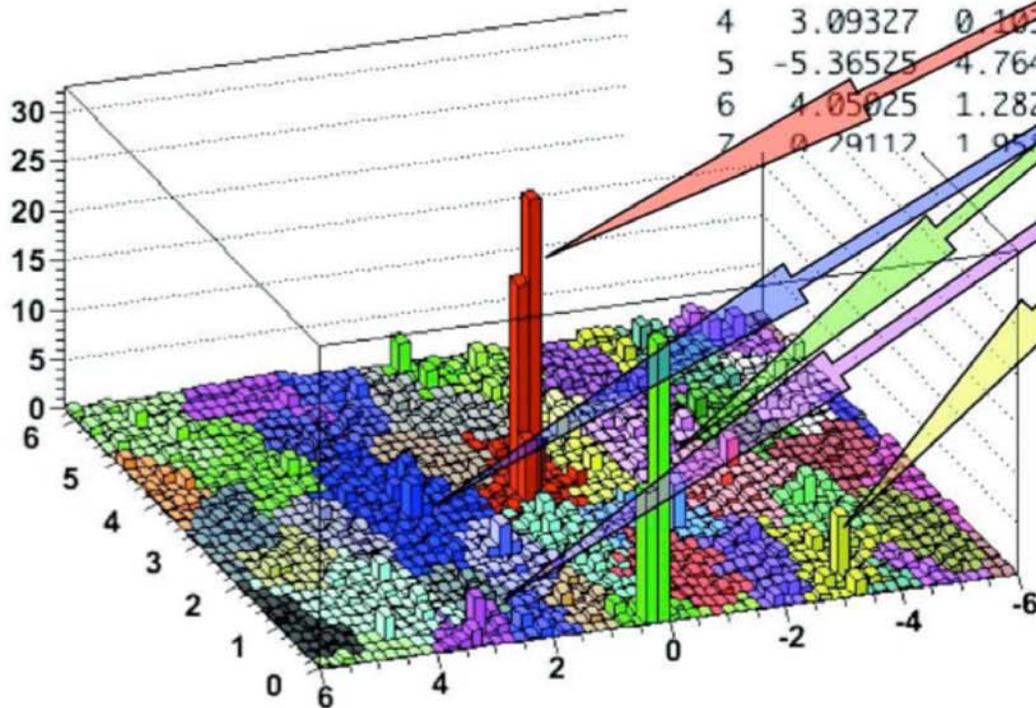

# Event By Event Pileup Subtraction

- FASTJET approach
  - Applicable to IR safe algorithms only, any jet flavor
  - Calculate jet area by ghost method
    - Put extra very small ghost energies into nodes of  $\eta$ - $\phi$  grid
  - Assume pileup jet area proportional to  $p_T$
  - Use low  $p_T$  jets to derive PU energy density
  - Estimate high  $p_T$  jets PU contribution using PU energy density and jet area
- CMS approach
  - Applicable to any algorithm, CaloJets only
  - Run regular jet reconstruction
  - Get average energy in CaloTowers outside reconstructed jets in every  $\eta$  ring
  - Subtract that energy from CaloTowers contributing to the jet
  - Re-calculate jet parameters using corrected energies of contributing towers

# Making use of *all* jets

iev 0 (irepeat 24): number of particles = 1428  
 strategy used = NlnN  
 number of particles = 9051  
 Total area: 76.0265  
 Expected area: 76.0265

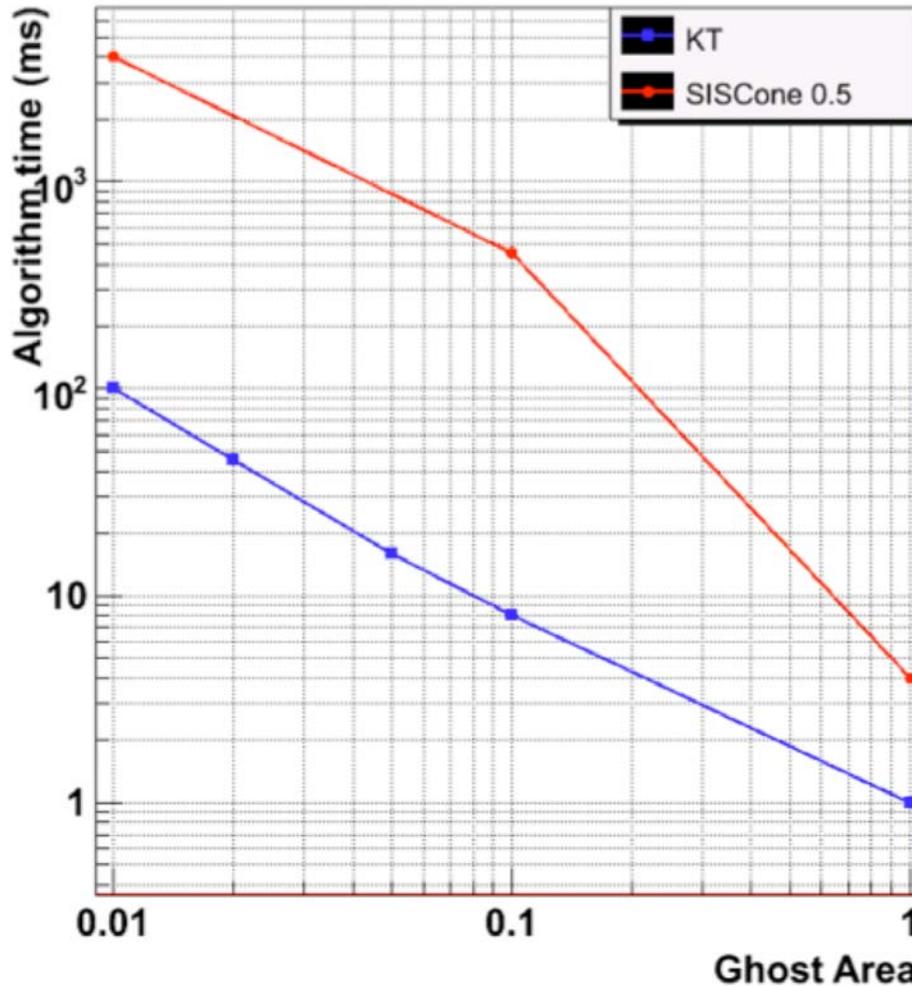

ijet	eta	phi	Pt	area	+-	err
0	0.15050	3.24498	69.970	2.625	+-	0.020
1	0.18579	0.13150	59.133	1.896	+-	0.020
2	2.33840	3.23960	31.976	4.749	+-	0.028
3	-3.41796	0.52394	26.595	3.084	+-	0.021
4	3.09327	0.10350	20.072	2.688	+-	0.023
5	-5.36525	4.76491	19.593	2.780	+-	0.012
6	4.05025	1.28270	15.861	3.592	+-	0.028
7	0.79117	1.95875	11.566	2.114	+-	0.018

Approximate linear relation between Pt and area for minimum bias jets.

Can be used on an event-by-event basis to correct the hard jets

# JetArea/PU Subtraction Costs

d - ghosts grid step  
R - jet radius

$$\Delta S \approx \sqrt{\frac{2\pi R}{d}}$$

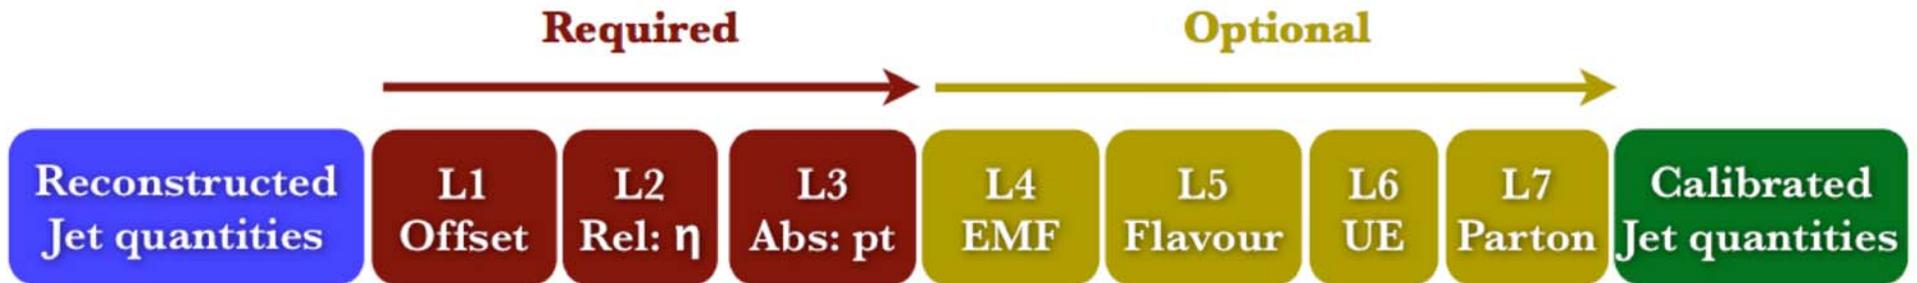

$$S \approx \frac{\pi R^2}{d^2}$$

$$\frac{\Delta S}{S} \approx \left(\frac{d}{R}\right)^{3/2}$$

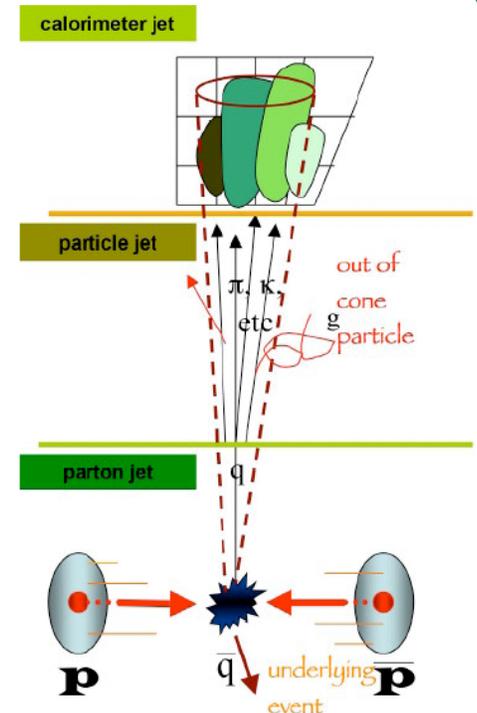

$$\left. \begin{array}{l} R \approx 0.5 \\ \frac{\Delta S}{S} \approx 10\% \end{array} \right\} \Rightarrow d \approx 0.1$$

$$\Rightarrow \text{GhostArea} \approx 0.01$$

# Jet Energy Scale

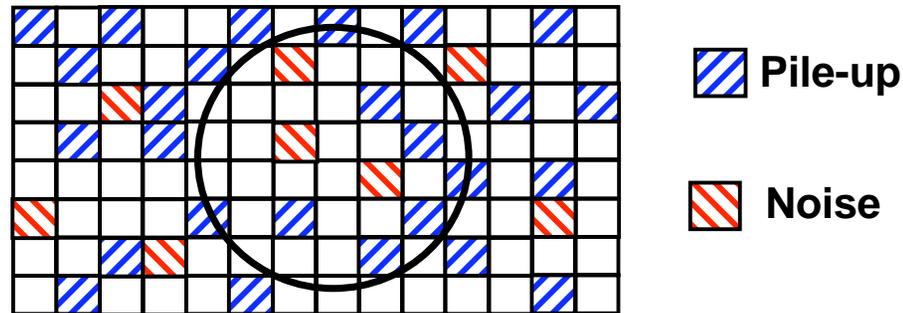

- Jet corrections
  - Generic: applied to all jets
  - Optional: fine tuning for specific jet types/hypothesis
- Factorized (chained) corrections approach
- Different jet correctors are services in CMSSW
  - Chained corrector is a service on top of individual correctors
- Use cases:
  - **Producers** to apply corrections to all jets, produce new jet correction
  - Use correction services directly from **analysis modules**
  - Use simple corrections (not including extra event information) from **FWLite/ROOT scripts**

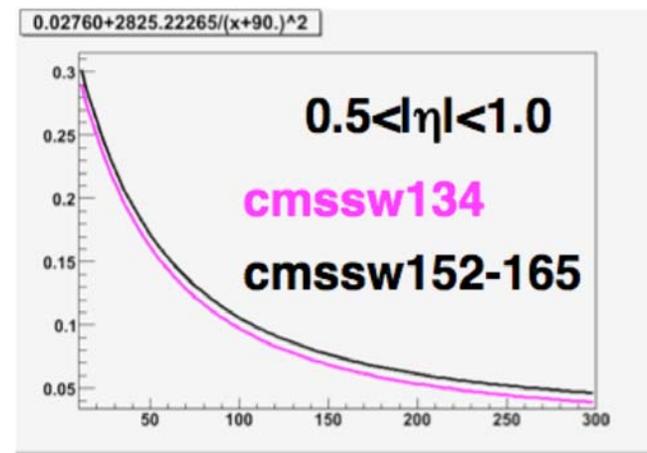

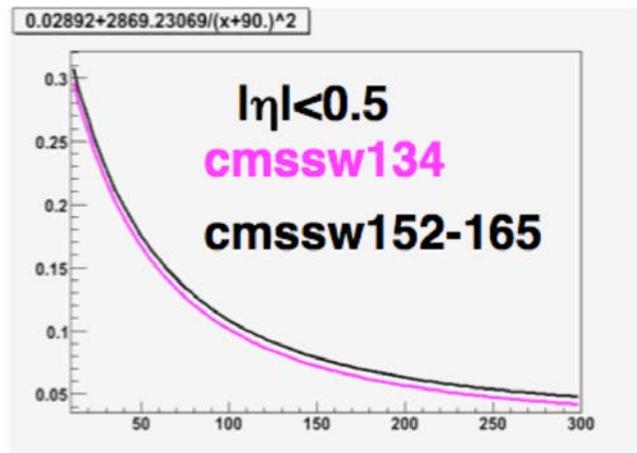

# L1: Offset/Zero Suppression

Offset in Jet Area In Calorimeter

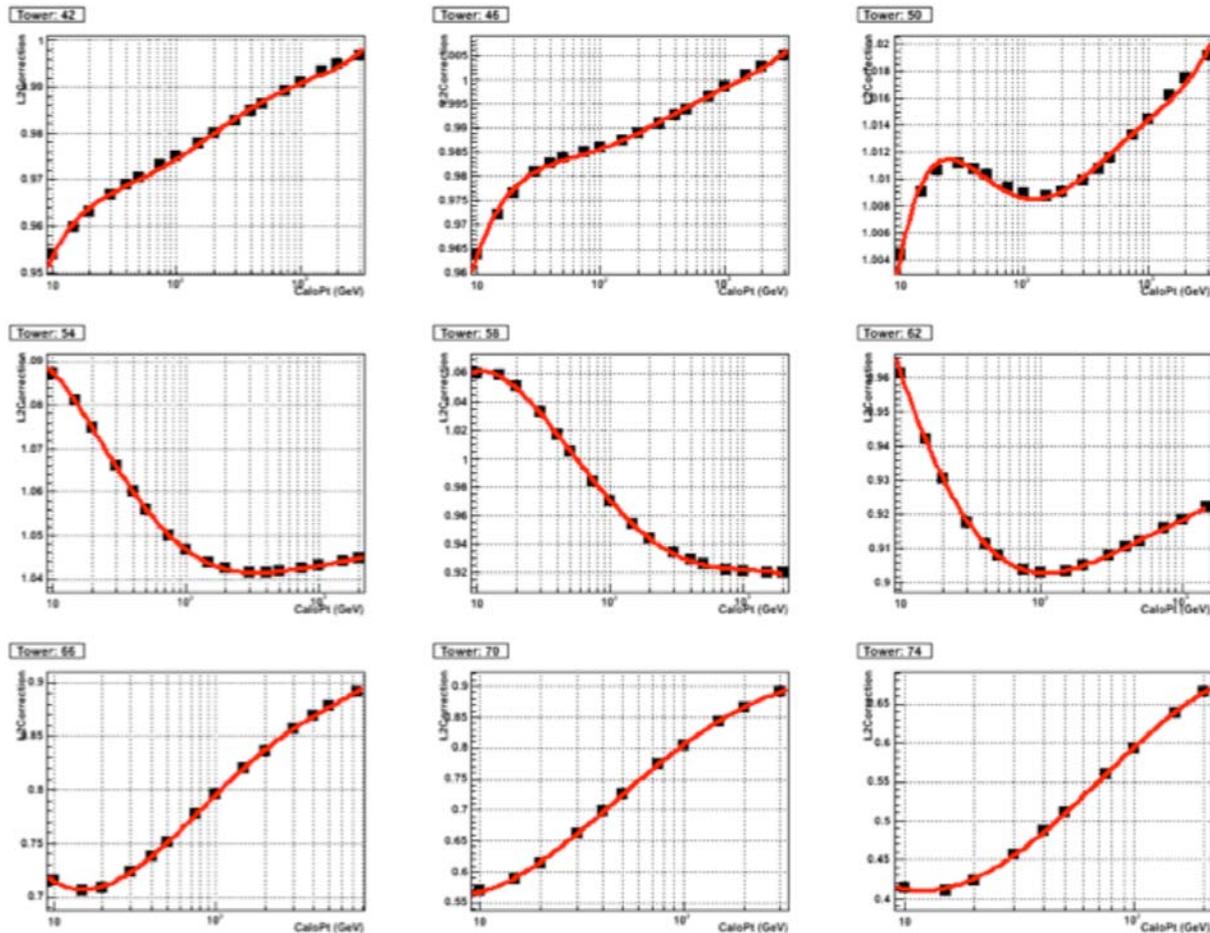

Parametrization:

$$\left( \frac{E_{Trec}^{NoCut} - E_{Trec}^{SchemaB}}{E_{Trec}^{SchemaB}} \right) = A0 + \frac{A1}{(E_{Trec}^{SchemaB} + A2)^2}$$

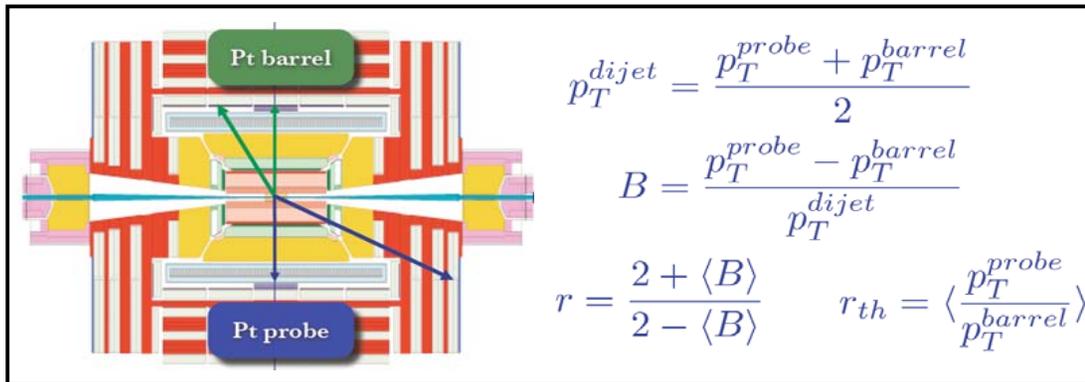

# L2: Relative to Barrel ( $\eta$ , $p_T$ )

The fitting function is flexible enough to be used in all  $\eta$  bins although the Barrel scale is considerably smaller than the Endcap and Forward (*backup III*).

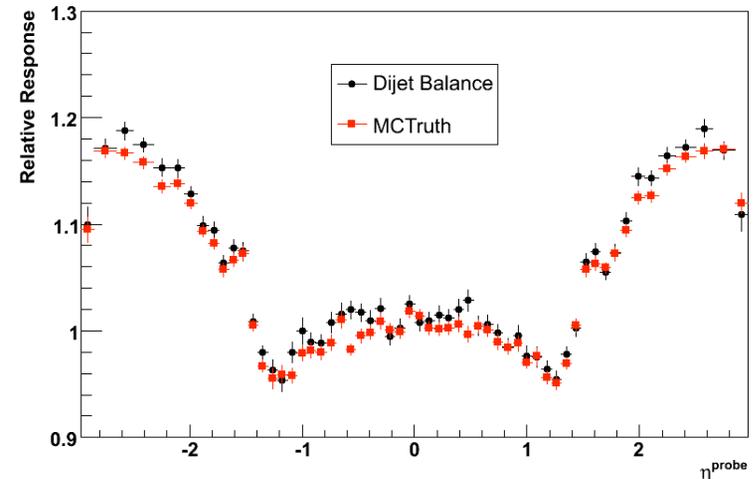

- No assumptions about  $\pm\eta$  symmetry

# Measuring Relative Scale: Dijet Balance

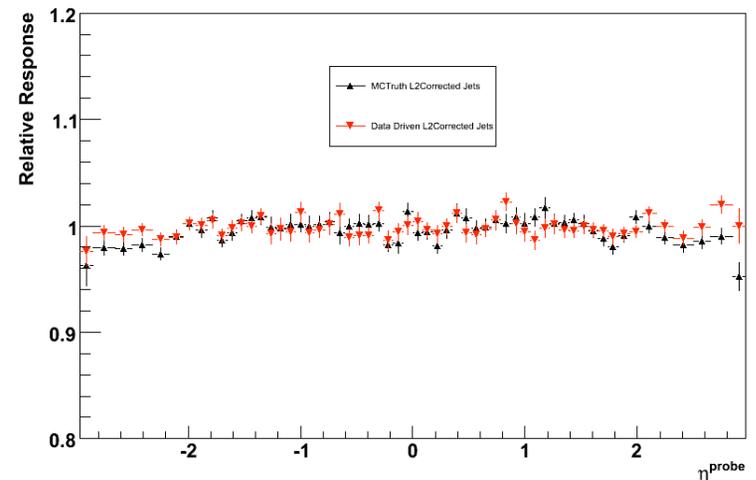

- Utilize  $p_T$  conservation for dijet events
- Use dedicated calibration triggers to collect dijet events

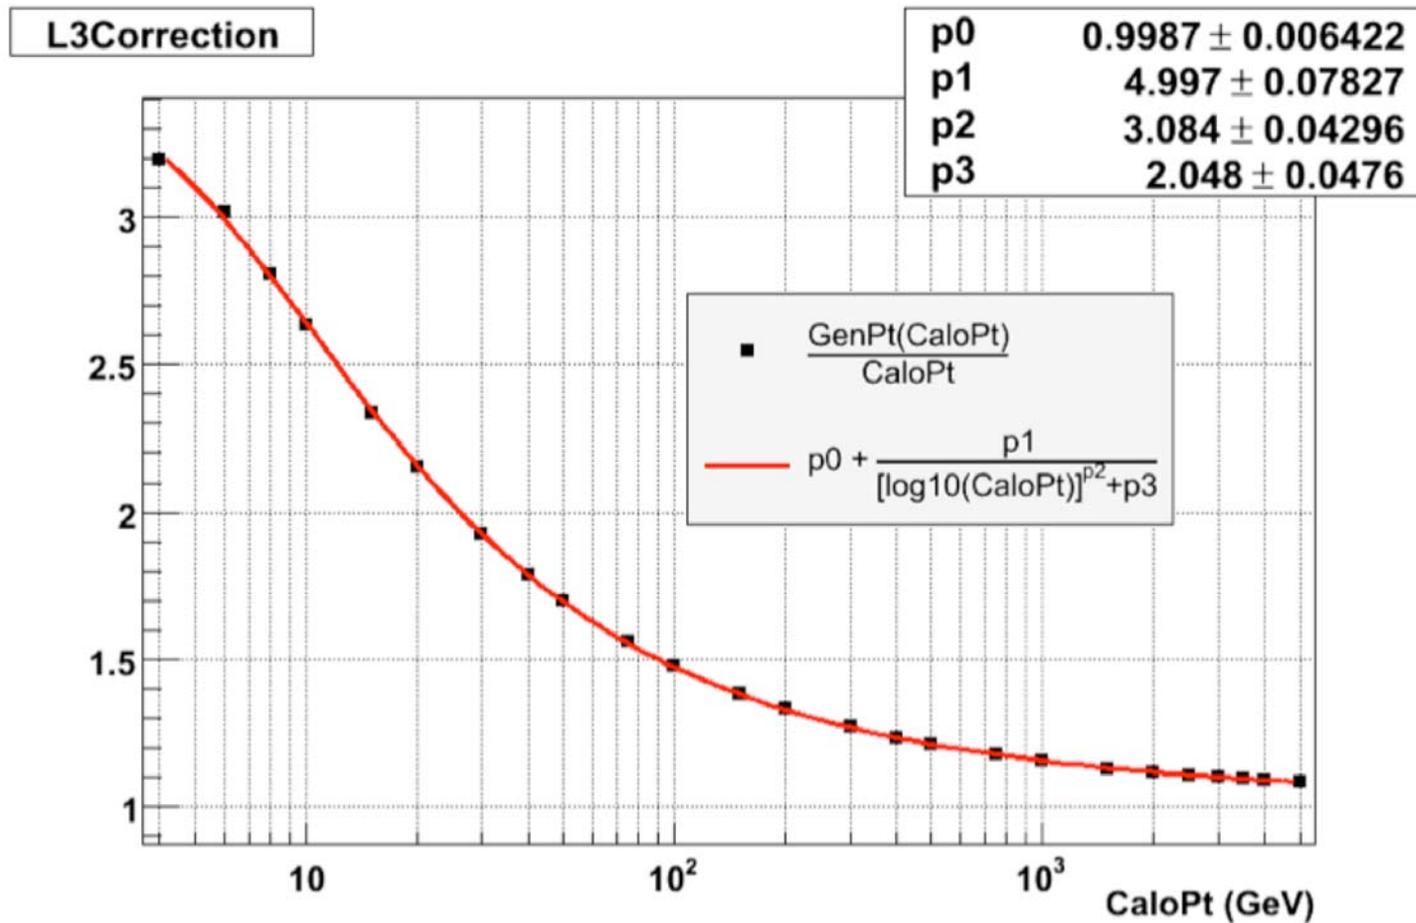

Before Corrections

After Corrections

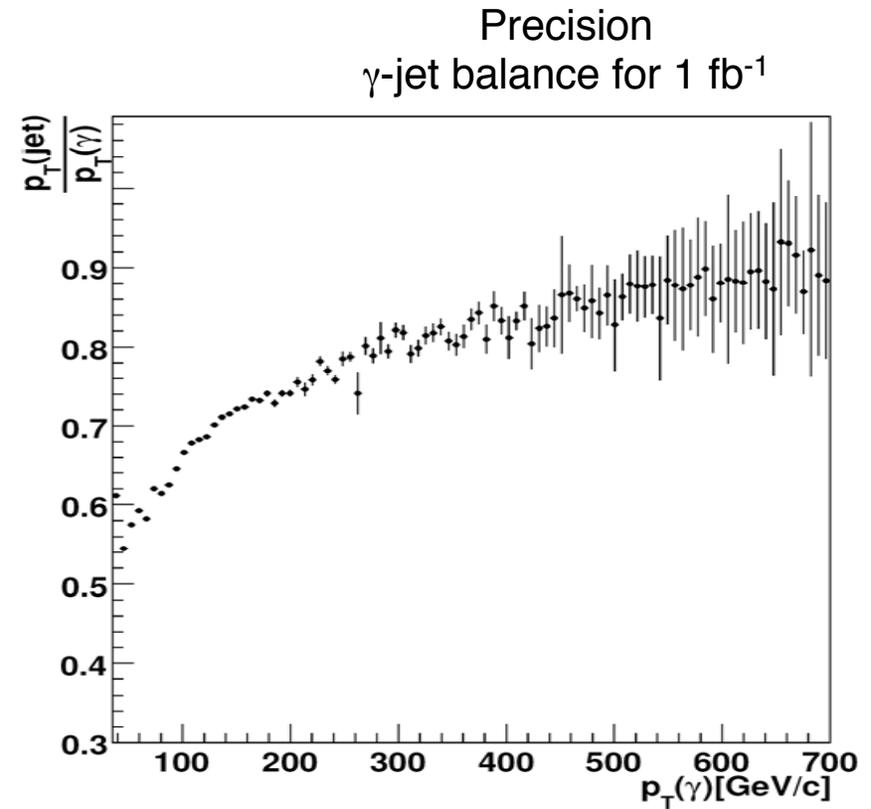

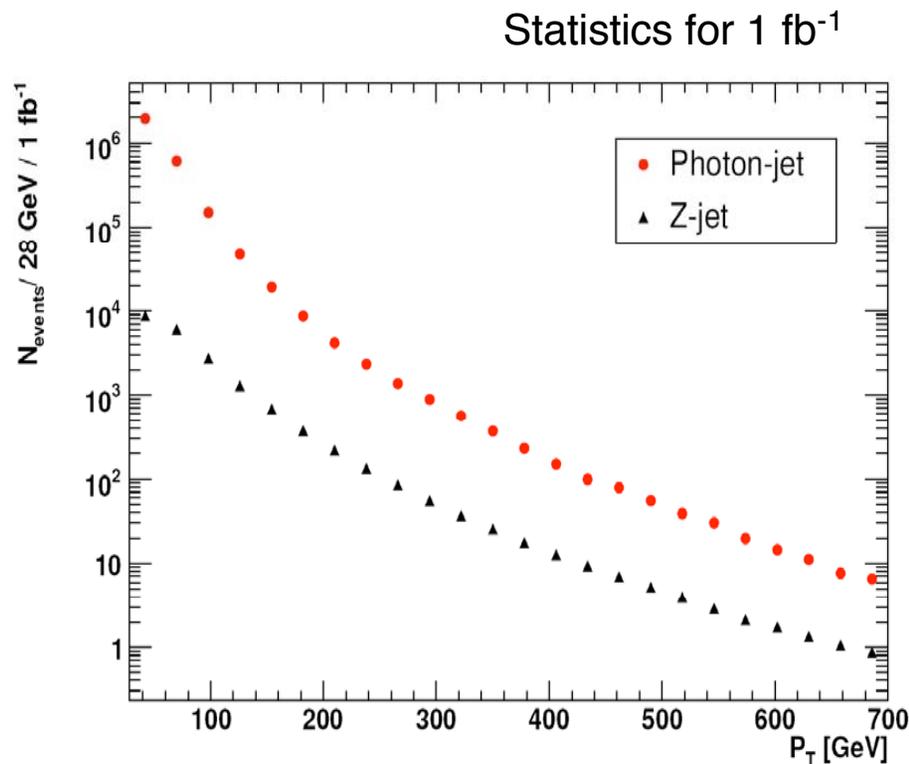

# L3: Absolute Scale ( $p_T$ )

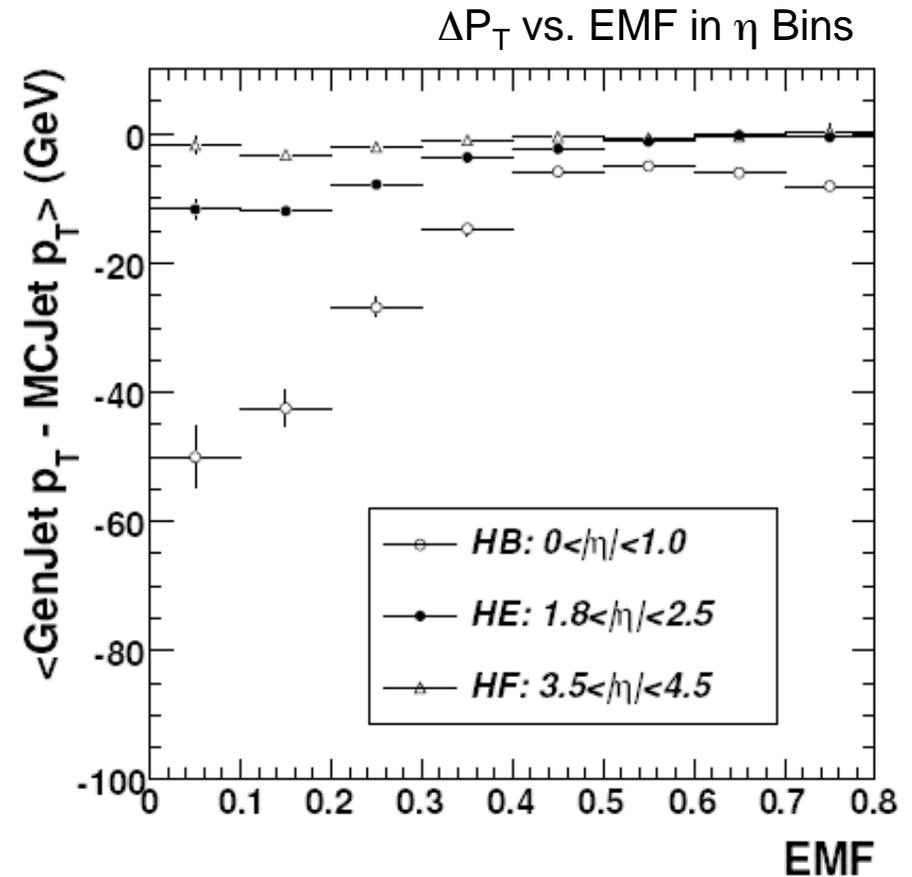

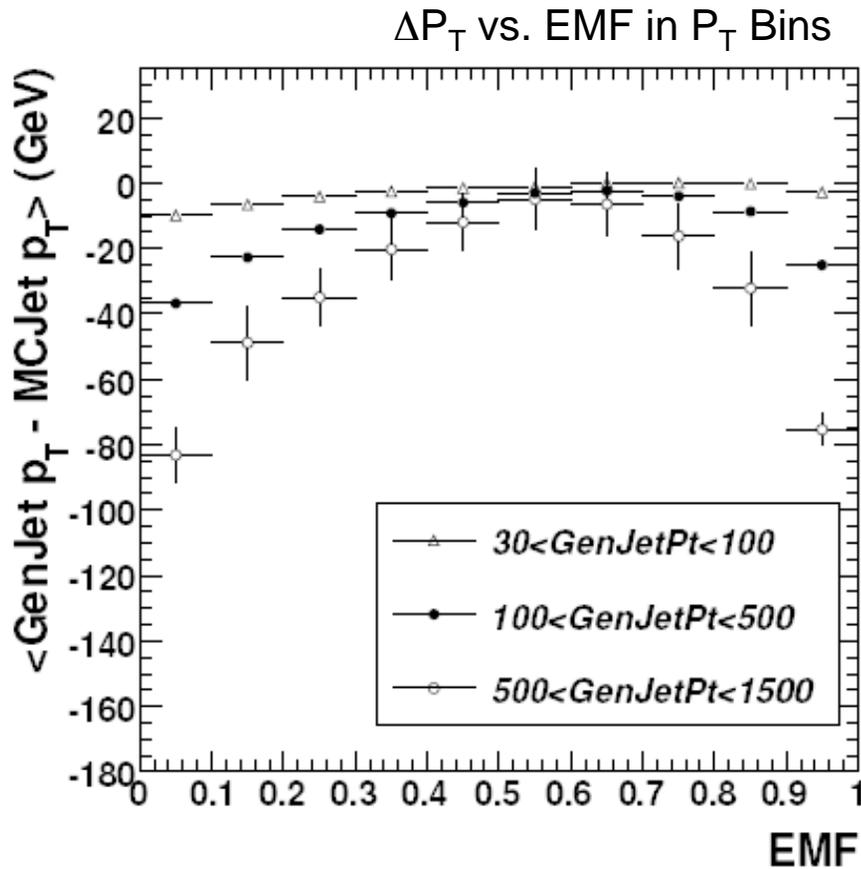

# Measuring Absolute Scale: $\gamma/Z$ Balance

- Utilize  $p_T$  conservation for  $\gamma$ -jet and  $Z(\mu\mu)$ -jet events
- Rescale back from parton level to particle level using MC

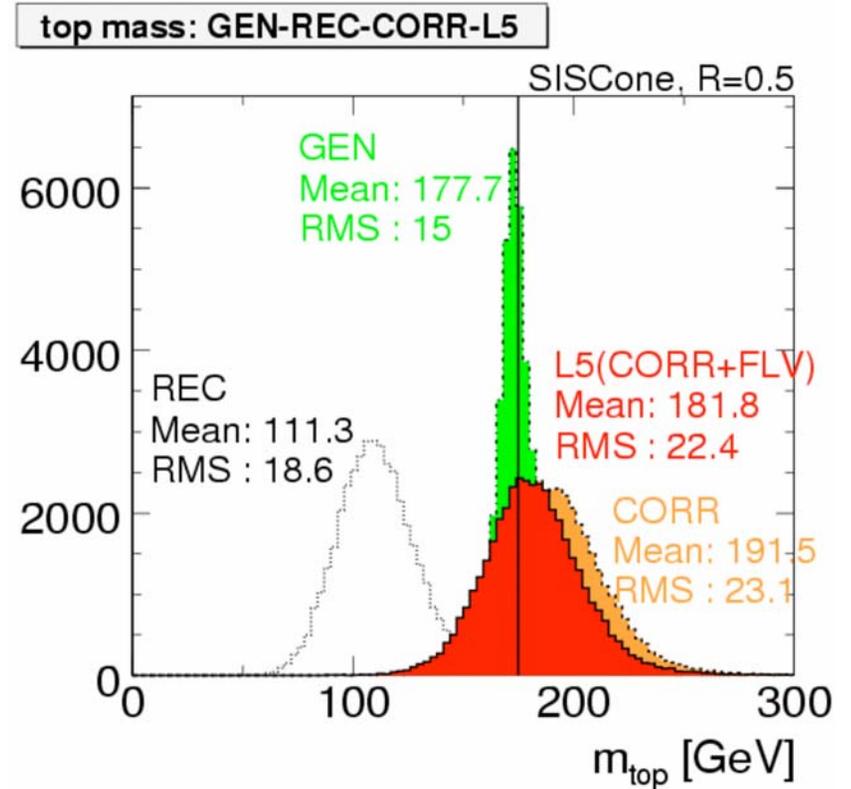

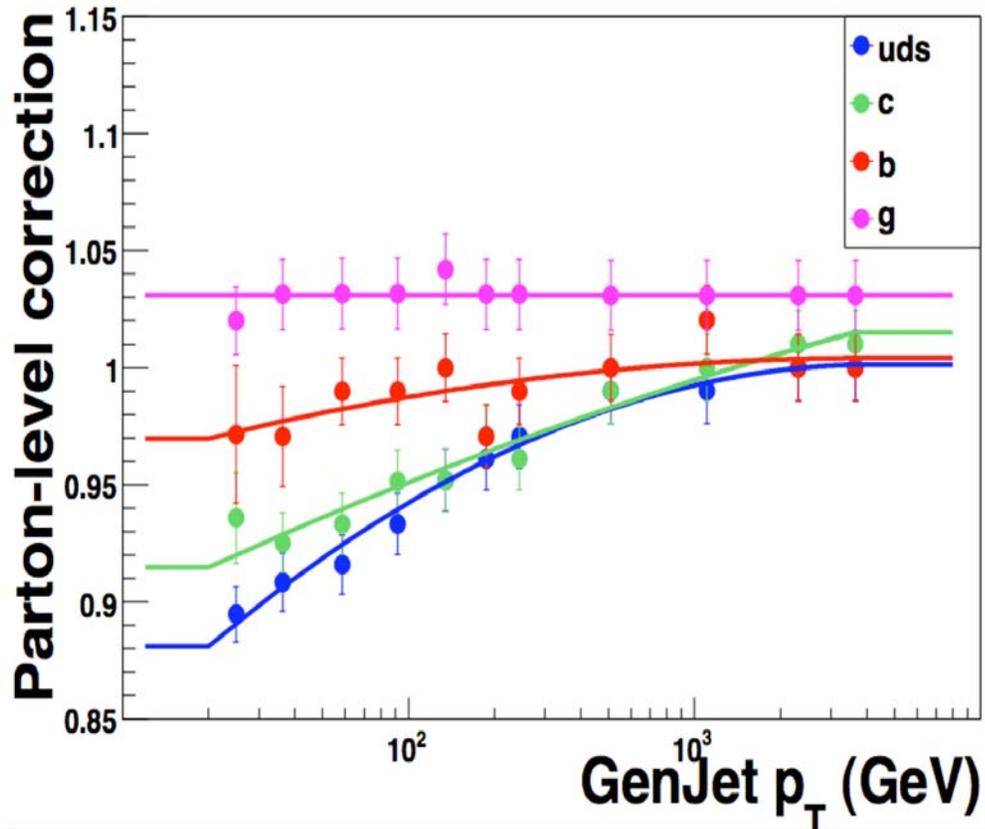

# L4: Electromagnetic Fraction

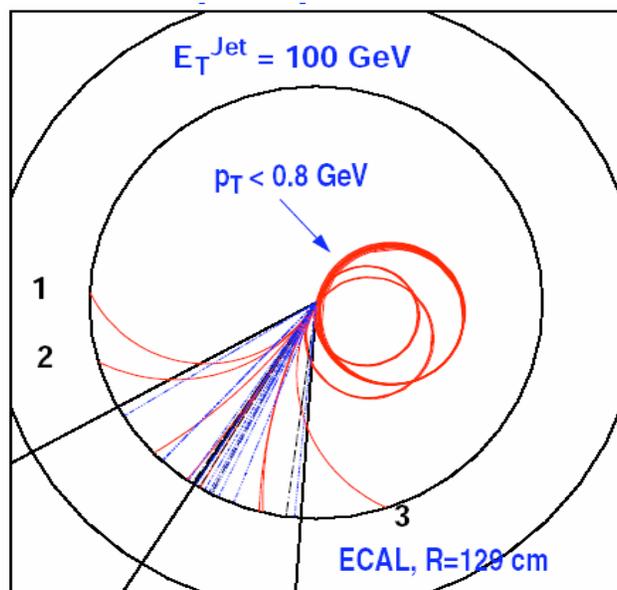

- Corrects uncompensated Calorimeter response

# L5: Flavor Corrections

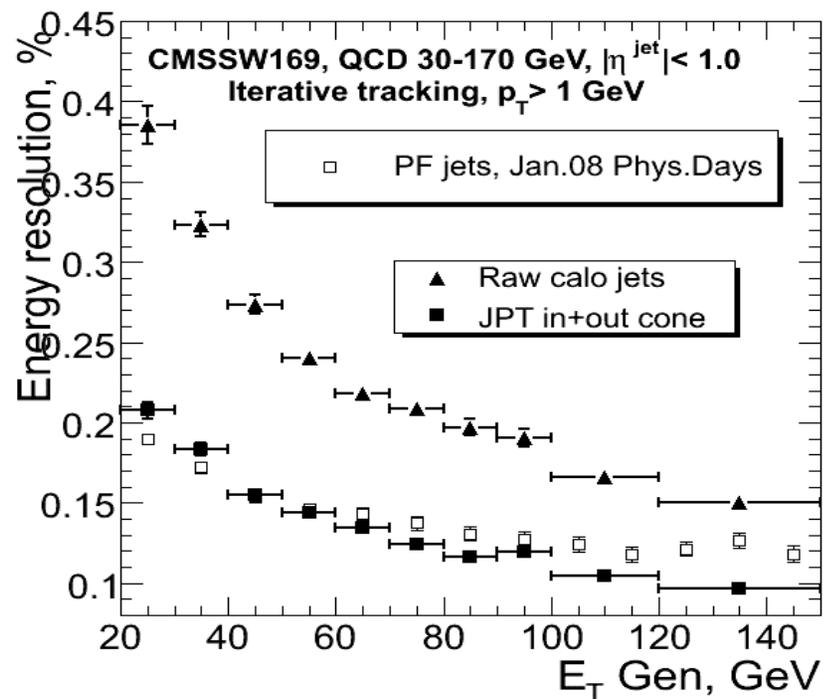

- Scales jet energy to particle level
  - Needs jet flavor hypothesis *a priori*

# Track Corrections

1. Reconstruct calorimeter jet
2. Subtract expected response of "in-calo-cone" tracks from calo jet  $E_T$  and add track momentum
3. Add momentum of "out-calo-cone" tracks

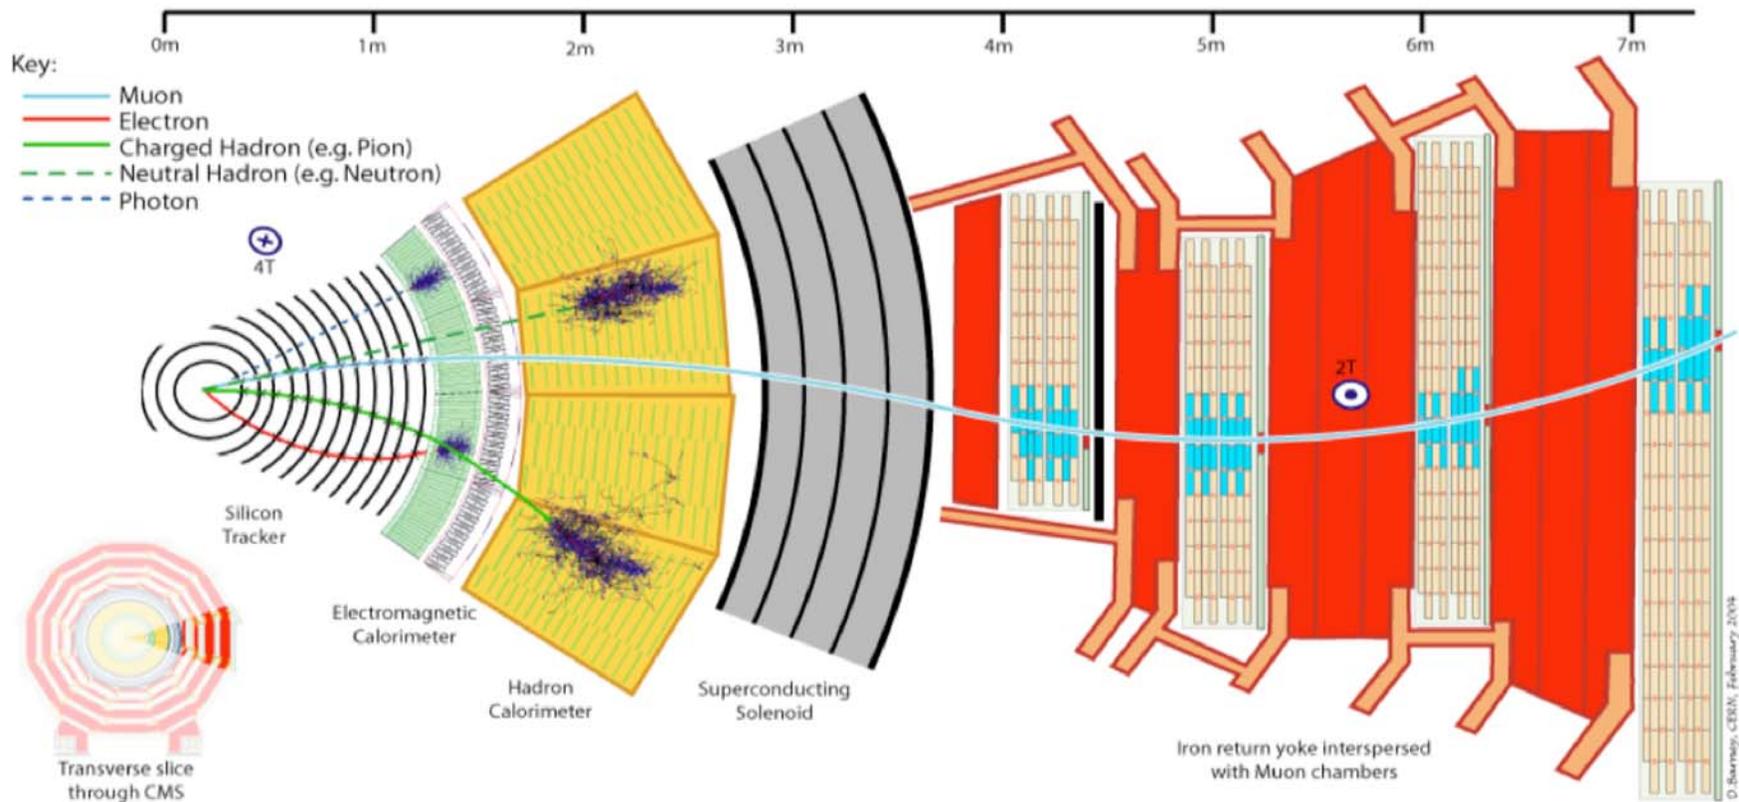

# Conclusions

- Jet reconstruction in *CMS* is mature
  - Infrastructure is stable for years
  - Bells and twisters still being added, further polishing
    - Infinite process anyway
  - Algorithms to be used in *CMS* analysis are established
    - At least for the beginning of data taking
  - Still flexible enough to accommodate special desires for special analysis
- Jet calibrations are ready for data taking
  - MC based corrections for the very beginning of data taking
  - Calibration data samples and procedures to extract corrections from data ( $10\text{pb}^{-1}$ ,  $100\text{pb}^{-1}$  scenarios)

BACK UP SLIDES

# CMS Detector

# Jet Energy Clusterization

- We are mostly interested to reconstruct parton level objects parameters basing on visible measurables
  - Direct measurements for muons
  - Corrections for bremsstrahlung / conversion for electrons and photons
  - Multiple steps conversions for quarks/gluons:  
original partons
    - ↳ hadronization into long living particles
    - ↳ showering in EM and HAD calorimeters
    - ↳ measured energies
  - Original parton is seen as energy cluster in the calorimeter (and tracker), a.k.a. Jet
  - Algorithms for energy clusters search
    - a.k.a. Jet Reconstruction

# FastJet Package

- Stand alone C++ package supported by G.Salam&Co
- Contains
  - Fast implementation of  $k_T$  algorithms family
  - SIScone
  - Ancient: MidPoint, JetClu, etc.
  - Newer: anti-kt
- Provide bridges
  - Between different experiments
  - Between experiments and theory
- CMS uses FastJet for  $k_T$ , SIScone

# Jet Area

- May be well defined for IR safe algorithms only
